```
— . (1)
int Max(Linklist p)
    if (!p->next)
        return p->data;
    else
    {
        int max = Max(p->next);
        return p->data >= max ? p->data : max;
    }
}
 (2)
int Length(Linklist p)
{
    if (!p->next)
        return 1;
    else {
        return Length(p->next) + 1;
    }
}
 (3)
int Add(Linklist p,int n)
{
    if (!p->next)
        return p->data;
    else {
        double ave = Add(p->next, n-1);
        return (ave *(n - 1) + p -> data) / n;
    }
}
二.判断入栈序列是否合法(注:这里写的程序只有输入正常的可能出栈序列时才能正确运
行, 如输入: 7, 4, 3, 5, 6, 2, 1。如果输入: 5, 7, 5则程序无法正确运行; 默认入栈
顺序为 1-n)
#include < iostream >
using namespace std;
struct Stack {
    int data;
    int* base, * top;
};
void InitStack(Stack& s) {
    s. base = new int[105];
```

```
s. top = s. base;
void Push(Stack& s, int value) {
    *(s. top++) = value;
void Pop(Stack& s) {
    *s. top--;
}
bool Empty(Stack s) {
    if (s. base == s. top) {
        return true;
    return false;
}
int GetTop(Stack s) {
    return *(s. top - 1);
}
int main() {
    int m = 0;
    char c = 0;
    int n = 0;
    int arr[100] = \{ 0 \};
    for (m = 0; ; m++)
         scanf_s("%d", &arr[m]);
        c = getchar();
        n++;
        if (c != ',')
             break;
    }
    Stack s;
    InitStack(s);
        for (int i = 0, j = 0; i < n; i++) {
             Push(s, i + 1);
             while (!Empty(s) && GetTop(s) == arr[j]) {
                 Pop(s);
                 j++;
             }
        }
         if (Empty(s)) {
             cout << "合法" << endl;
         else {
             cout << "不合法" << endl;
```

```
}
三.表达式求值
#include <stdio.h>
int a[10] = \{ 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 \};
int operate[10];//操作
int b[10];
void print(int sum)
   printf_s("%d", b[1]);
   int i, j;
    for (i = 2, j = 1; i < sum + 1; i++)
       while (operate[j] == 0)
           j++;//如果操作符为空,则使j增加直至达到第一个操作符不为空的j的位置
       if (operate[j] == 1)
           printf_s("+");
       else
           printf_s("-");
       j++;
       printf_s("%d", b[i]);
   printf_s("\n");
}
void judge()
   int sum = 1;
   int i, j = 1, now = 0;
   b[1] = a[1];
    for (i = 1; i < 9; i++)
       if (operate[i] == 0)
           b[sum] = b[sum] * 10 + a[i + 1];
       else
       {
           b[sum] = a[i + 1];// '+' 或 '-' 则把a[i+1]都当作个位数处理即可
   }
   now = b[1];
    for (i = 2, j = 1; i < sum + 1; i++)
       while (operate[j] == 0)
           j++;
```

```
if (operate[j] == 1)
           now += b[i];
       else
          now = b[i];
       j++;
   if (now == 110)
       print(sum);
void dfs(int k)
   if (k == 9)
     judge();
      return;
   int i;
   for (i = -1; i < 2; i++)
       operate[k] = i;
       dfs(k + 1);
}
int main()
   dfs(1);
   return 0;
```
